

## **Residents of the Pines & Settlement at Utica Lake Developments**

Many homes in the Village have grinder pumps to pump household sewage to the sanitary sewer system where topography does not allow traditional gravity discharge. The service life of the pumps is typically 6 to 12 years. Due to the age of the Pines and the Settlement at Utica Lake developments, many homeowners will need to replace their grinder pump in the next few years.

It is important that the right type and size is used for replacement. The low pressure sewer system in the village was designed with all homes using the same pump. The pressure and low flow rate of the pump is important to the overall system functioning properly. An undersized or oversized pump could adversely impact you or your neighbor. In addition, an off-brand manufacturer pump may not provide the expected service life.
